

# An Examination of 48 kHz WB HF Channel Availability in the US and UK

John Nieto, William Furman, Eric Koski  
Harris Corporation  
RF Communications Division

**THIS INFORMATION IS NOT EXPORT CONTROLLED**

THIS INFORMATION IS APPROVED FOR RELEASE WITHOUT EXPORT RESTRICTIONS IN ACCORDANCE WITH A REVIEW OF THE INTERNATIONAL TRAFFIC IN ARMS REGULATIONS (ITAR), 22CFR 120-130, AND THE EXPORT ADMINISTRATION REGULATIONS (EAR) 15 CFR 730-774.

- Introduction
- Measurement System Overview
- Results – Expanded to include 48 kHz channels
- Summary / Way Forward

- HF continues to be an important data communications technology
- Increasing need by the user community for higher data rates
- Recent US MIL-STD-188-110C defines a family of wideband HF data waveforms which spans contiguous bandwidths from 3 to 24 kHz
- Other channel–bonding approaches combine multiple 3 kHz channels to achieve higher data rates
- An important consideration when fielding a wideband HF data system is the channel availability
- This presentation extends a presentation given at last years Nordic HF13 Conference, and processes the same collected data to examine 48 kHz channel availability

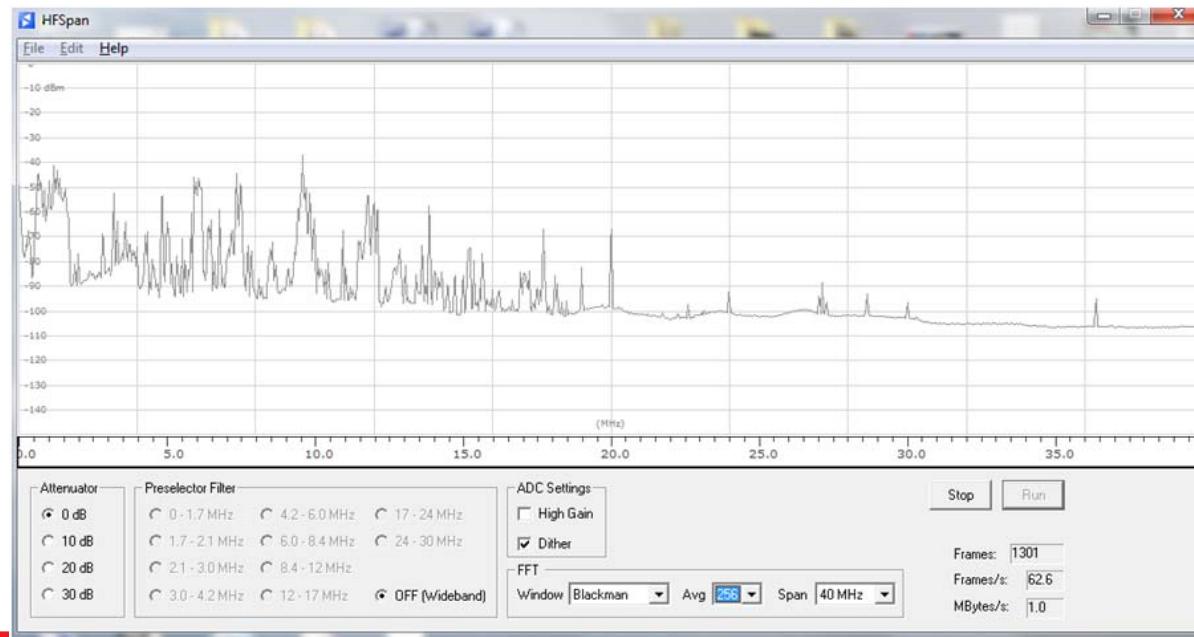

- Harris has developed an adaptive system that selects the best channel, determines available bandwidth and offset for wideband communications.
- To gauge the suitability of wideband HF over specific links needed to be able to survey and measure channel availability
- Channel availability measurements need a quick revisit time so that links that are suitable for tactical messages, with short wideband ALE signaling and adaptive data link protocols, can be properly detected

- Perseus SDR
  - Full HF Coverage
  - 14 bit 80 MS/s
  - FPGA can shift LO and decimate to 48 kS/s through 2 MS/s
  - USB interface to DSP
  - Software Developers Kit
  - Same SDR as used by Berg
- Clifton Labs Z1501D
  - Active Antenna
  - Short whip
  - 20 kHz to 30 MHz
  - FET to couple to 50 ohm

- Monitoring was done at locations in the Rochester, NY and Wokingham UK area in May and June 2013
- Approximately one week of 24 hour data was collected at each site
- Perseus HFSpan utility used to spot check for any local interference

# US Results 3 kHz

- Availability does decrease as bandwidth increases
- Increased occupancy noted during evening hours
- As expected high availability noted for higher (non-propagating) frequencies
- Overall availability defined as 24 hr average 2-15 MHz
- 3 KHz bandwidth very high availability- Overall 85%
- 12 kHz slightly less availability – Overall 78%
- 24 kHz availability still greater than 50% during evening hours and greater than 75% during daytime hours  
Overall 72%
- 48 kHz availability - Overall 63%

- Overall 3 kHz results show less availability than US but still many cases greater than 75% during the day and 50% during the evening **Overall 82%**
- 12 kHz results show a slight drop in availability with some evening segments below 50% **Overall 75%**
- 24 KHz results illustrate further reduction in availability, however still considerable segments greater than 50%. The evening hours far the worse with some segments dropping below 50% availability **Overall 68%**
- **48 kHz - Overall 57%**
- UK results show some segments that indicate high availability all day, such as 3 and 10 MHz, that may be due to wider bandwidth local interference

- The analyzed data was further examined based on two different frequency band use case assumptions
  - NVIS 4-8 MHz
  - 2000km 8-15 MHz
- The average CMA was calculated for each frequency segment for each location and channel bandwidth
- Overall availability is lower in the UK, though still quite useable
- In the US availability is similar for both types of links
- In the UK, availability is lower for the NVIS links, possibly indicating a much higher occurrence of closer users eroding the availability

	U.S. 3 kHz	U.S. 12 kHz	U.S. 24 kHz	U.S. 48 kHz	U.K. 3 kHz	U.K. 12 kHz	U.K. 24 kHz	U.K. 48 KHz

- Harris has fielded a low cost, easily transported, channel availability measurement system
- System has been used to do some preliminary measurements of wideband HF channel availability in 3, 12, 24 **and 48** kHz bandwidths
- A data collection and analysis procedure has been proposed
- A new metric, the Channel-Minute availability has been proposed and used to more accurately capture channels that could be used by an adaptive wideband ALE based system for the conveyance of tactical HF messages
- Harris has tested an adaptive wideband HF system in a number of locations worldwide, all with good results
- Results show higher occupancy in the UK compared to US but still quite useable for the wider bandwidth channels

- Inexpensive system could be fielded by a number or countries/ organizations
- Collected data could be shared among all participants
- Harris could make available the data collection and data analysis software used for this paper
- Perhaps under the HFIA a working group could be established to define and agree upon the definition of availability metrics and the interpretation of results
- February 2014 – First Meeting of the HFIA WB HF Channel Availability Working Group
